U. S. Department of Agriculture
Statistical Reporting Service

Acknowledgment

The acreage, production, utilization, monthly and season average price, and crop value statistics for Florida as shown in this summary are official estimates of the Florida Crop and Livestock Reporting Service. Corresponding data for other citrus states are from official reports of the USDA, Statistical Reporting Service. Canned and frozen pack statistics were compiled by the Florida Citrus Processors Association. Where data are from other sources, appropriate references appear.

Records of the Division of Fruit and Vegetable Inspection, Florida Department of Agriculture and Consumer Services, were employed in production and utilization estimates. The Citrus Administrative Committee assisted in assembling these data.

Many producers, shippers, canners, sales agencies, transportation firms, and others associated with the citrus industry voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The report was assembled under the direction of James W. Todd and Robert R. Terry of the Florida Crop and Livestock Reporting Service.

FLORIDA WEATHER HIGHLIGHTS, SELECTED AREAS AND MONTHS, 1982-83 CROP YEAR

Central and south Florida weather was notable in the spring and summer of 1982 because of above average amounts of rainfall and in the winter months because of the absence of destructive freezing temperatures.

Cumulative rainfall amounts by October for the year were over 12 inches above average in central Florida and 9 inches in south Florida. These excellent rainfall and normal temperature conditions led to excellent tree recovery from the January freezes during the two previous winters.

The first cold front of the season moved through the State the week ending October 1 and brought temperatures in the mid sixties and rainfall amounts ranging up to 5 inches. Other fronts in October also lowered temperatures, some as much as 15 degrees below normal, throughout the State. Weekly rainfall amounts were quite variable.

The first week of November brought another front through the State, this time with rains averaging up to 8 inches along the lower east coast. Temperatures however, were mostly above average levels. Weather conditions for the remainder of November were quite variable with scattered light rainfall and mild seasonal temperatures.

Cool nights and generally lower temperatures going into the winter months were beneficial in slowing tree growth, leaving them less vulnerable to freezing weather.

December weather began with above average temperatures and only traces of rainfall. A rapid moving cold front pushed through the State on the 12th but temperatures quickly warmed. Another, stronger front on the 15th and 16th brought scattered frost on the 17th in many central Florida areas. Temperatures averaged up to 9 degrees below normal throughout citrus areas the last week of December.

Temperatures moderated in early January with rainfall amounts generally very light for most of the month. A cold front brought cold, dry air on the 12th through the 14th. Light frost was observed into the Everglades with temperatures averaging 5 degrees below normal. A light freeze on the 16th also brought below average temperatures. New growth on citrus had been observed in scattered areas and the cold weather stopped this growth from further development. Frost on several mornings in late January was observed but no damage to fruit or trees was reported.

February brought spring-like storms that left up to 4 inches of rain in some locations. Patchy frost on the morning of February 9 again did no damage. Temperatures averaged slightly less than normal throughout the entire month, but rainfall was well above normal for February. Each wave of cool weather brought 1 - 4 inches of rain in all areas. By the end of the month most reporting stations had recorded 2 - 3 times average cumulative rainfall for the calendar year.

March weather was seasonal with numerous windy days. Several cold fronts moved through the citrus belt, bringing cool temperatures and scattered frost but very little detrimental effect to citrus. Rains again were much above normal with some rain each week in most all areas.

Even though winter temperatures were below normal levels for several weeks at a time, no sharp drop to damaging levels was experienced. In only a few instances did temperatures in the citrus belt drop to below the freezing point and then for only short durations in colder locations.

Spring weather was wet with the exception of several weeks in late May which were dry. Summer weather was about normal with weekly showers.

Florida's 1982-83 season began with an open bloom period in early-to-mid March of 1982, two to four weeks earlier than is considered normal. Temperatures remained at near normal levels throughout the spring. Rainfall levels in most growing areas were above long-term averages with some areas receiving 50 percent more than normal.

With these ideal growing conditions, trees began a good recovery from the freezes of the previous two seasons. Weather conditions in the citrus belt are described in detail on the preceding page.

Bloom was quite variable with some groves setting very little fruit from the regular bloom period. A later bloom in June and July set heavy amounts of fruit in some groves, especially those which had a light set of regular bloom fruit and varying amounts in other groves that had a good bloom in the regular period. In most instances this late bloom fruit was picked along with the regular fruit.

Final orange production at 139,500,000 boxes was only 2.5 percent less than the initial October forecast of 143,000,000 boxes. This volume was still well below the previous ten year average production of 171 million boxes.

FCOJ yield was final at 1.48305 gallons per box at 42.0 degrees Brix, a record high yield. Early-mid varieties of oranges averaged 1.41625 and Valencias averaged 1.55933 gallons.

Grapefruit production at 39,400,000 boxes was the lowest since the 1969-70 crop and well below the ten year average production of near 49 million boxes.

California's orange production was 73,200,000 boxes, a record high crop for both Navels and Valencias. Grapefruit production was off slightly at 7,300,000 boxes. Lemon production was 19,900,000 boxes, eight percent more than the previous season.

Arizona orange production was 3,800,000 boxes, the largest crop since the 1976-77 season. Grapefruit production at 2,700,000 boxes was close to average. Lemon production was 3,050,000 boxes, somewhat smaller than production during the last few seasons.

Texas orange production totaled 5,680,000 boxes, slightly less than the previous season. Grapefruit production at 11,200,000 boxes was 19 percent less than the previous season's record high 13,900,000 boxes.

TREE CENSUS

The Florida Crop and Livestock Reporting Service first began indexing the State's commercial citrus groves on aerial photography as of January, 1966. Ground crews in 4-wheel drive vehicles identify all the State's groves by year in which set, fruit type, and row spacing. Photo interpreters in the Orlando office then delineate the groves by variety blocks on positive photo transparencies at a scale of 1 inch to 660 feet. Variety blocks are measured with planimeters to obtain acreage and then indexed by land section.

The 1966 survey indicated there were 66,441,000 commercial citrus trees on 858,082 net acres of land. In addition, the survey provided acreage and number of trees by county, variety and year set. But, of equal importance, the inventory was designed for quick and economical updating. Since that time, the production area has been resurveyed each second winter - 1968 through 1982 to determine changes.

Photographing begins in November when weather conditions are most favorable and is generally completed in 80 to 90 days. The same three-mile-wide flight lines established in 1966 are photographed on each succeeding flight. Approximately 14,000 square miles of photography is obtained at a 1 to 30,000 scale.

The last survey shows there were 847,856 acres of commercial citrus in Florida as of 1982. This is a net increase of 0.3 percent from the 845,283 acres in January 1980. New citrus groves set during the calender years of 1980 and 1981 totaled 54,515 acres which more than offset the 51,942 acres lost. Net increases occurred in the East Coast and Lower Interior growing areas.

In addition to enumerating changes in grove acreage, the surveys since 1976 were designed to give greater detail on acreage removals and additions. The 1982 results showed that nearly one half of the newly planted equivalent acres were large plantings on new land. Another 35 percent of the new plantings were resets in existing groves.

Only a little more than 10 percent of the lost acreage occurred because of commercial development with 47 percent occurring as vacancies in existing groves. Three major freezes in recent years account for most of the within grove losses.

Photographing for the 1984 census began in November 1983 and preliminary results should be available by August of 1984.

Florida, all citrus: Acres in commercial groves as of January, 1966 - 1982, with percent changes

Year	Acres	Change from previous survey	Change from 1966 survey
		Percent	
1966	858,082	- - -	- - -
1968	931,249	+8.5	+8.5
1970	941,471	+1.1	+9.7
1972	878,019	- 6.7	+2.3
1974	864,098	- 1.6	+ .7
1976	852,369	- 1.4	- .7
1978	831,235	- 2.5	- 3.1
1980	845,283	+1.7	- 1.5
1982	847,856	+ .3	- 1.2

1982-83 VALUE OF SALES, PRICES AND EXPORTS

VALUE

The preliminary on-tree value of all citrus for the 1982-83 crop year is $901,372,000. This is 21 percent more than the 1981-82 revised value of $713,324,000 but 13 percent less than the record high 1979-80 season total of $1,037,050,000.

Preliminary value is based on that part of the crop that was priced at harvest, about 30 percent of the total. When all participation plans and cooperative prices are finalized, a revised value is calculated.

The 1982-83 season average on-tree price of oranges was $5.25, an increase of 97 cents over the revised 1981-82 price of $4.28 per box. Grapefruit prices remained virtually unchanged at $2.08 per box compared to $2.09 for the previous season. About 10 million boxes less grapefruit were used in processingduring the 1982-83 season which helped hold this all methods of sales price unchanged. Processing prices fell to $.16 per box from the previous seasons' $.82 per box. The 1980-81 season's average processing price was $2.76.

The 1982-83 season delivered-in price for all priced fruit going into FCOJ was $1.14 per pound of solids, down from the $1.20 per pound for priced fruit during the 1981-82 season.

Florida, all citrus: Value of sales on-tree, crop years 1973-74 through 1982-83

Crop year	Value 1,000 dollars	Crop year	Value 1,000 dollars
1973-74	$359,388	1978-79	$ 966,916
1974-75	397,066	1979-80	1,037,050
1975-76	440,326	1980-81	953,350
1976-77	529,765	1981-82 1/	713,324
1977-78	848,680	1982-83 2/	901,372

1/ Revised. 2/ Preliminary.

COUNTY PRODUCTION

Estimates of citrus production by counties were prepared from objective survey data obtained from the citrus crop estimates program. Production for Florida has been distributed to counties based on the biennial citrus tree census, limb count survey data adjusted for droppage to end of season, and size data at maturity.

Tree numbers by county which are used in the estimates were obtained from the latest tree census. Data on production is obtained from several objective fruit surveys: limb count and size and droppage samples. Because of the statistical sampling design, counties with higher production in general have a greater number of fruit samples, and therefore estimates for these counties can be considered more reliable. Thus, for the same reason, estimates for the production areas are still more reliable.

PRICES

All on-tree prices reported by the U. S. Department of Agriculture's Statistical Reporting Service and the Florida Crop and Livestock Reporting Service represent the average price received by growers for their fruit by types. Prices are based on records of commercial fresh fruit and processed fruit returns. The term "on-tree" relates to fruit value before it is picked and hauled from the grove.

Each season, beginning with the first month that three percent of a fruit type is harvested, the Florida Crop and Livestock Reporting Service estimates an average monthly price. Fresh fruit sales organizations and a mail-out questionnaire to packers provide the average F.O.B. price and processors supply an average spot and cash price for fruit delivered to plants. From these values, an estimated charge for picking, hauling and packing is deducted to arrive at an on-tree price. The anticipated box utilization for the month is used to combine the fresh and processing price to obtain an average price for all methods of sales for each month. At the end of the season, monthly price averages are computed and weighted by boxes utilized, to provide the preliminary season average price.

A year later, after most processed products are sold, a survey of cooperatives and firms with market participation plans is conducted to establish a value of fruit previously classed as non-priced fruit. These prices, combined with spot and cash prices collected earlier, are weighted together to determine the final processing price received by growers for various varieties of citrus. Charges for picking, hauling and packing, as determined by University of Florida economists, are deducted from the weighted average of prices obtained from all segments of the citrus industry to arrive at the final on-tree price received by growers.

FOREIGN EXPORTS

Fresh exports of citrus to countries other than Canada and Mexico for the 1982-83 season were 9,903,000 cartons. This was the lowest amount shipped since the 1977-78 season.

Grapefruit exports accounted for 96 percent of the total with Japan the principal receiver. Over 68 percent of the total grapefruit exported went to Japan, with France receiving the second largest amount.

Orange exports increased from the previous season to 310,000 cartons. Puerto Rico was again the largest receiver, taking 50 percent of the total exported. Holland received the second largest amount.

Tangerine exports amounted to 34,000 cartons, up from 32,000 the previous season. Other specialty fruit exports totaled 34,000 cartons.

Frozen concentrated orange juice (FCOJ) is Florida's major processed product sold in export markets. Florida exported 12.2 million gallons in the 1982-83 season, up slightly from the 10.8 million gallons exported during the 1981-82 season. Canada is the major market for U. S. exports. Increasing Brazilian production and expansion of their export market limits market expansion opportunities for Florida.

Citrus box weights: Approximate net weight in pounds by fruit type and States

States	Oranges and others 1/	Grapefruit	Tangerines	Lemons	Limes
Florida	90	85	95	90	80
California	75	65	75	76	--
Texas	85	80	--	--	--
Arizona	75	64	75	76	--

1/ Includes Florida Temples and Tangelos at 90 lbs.

Florida citrus: Production of all citrus since 1886-87

History of Florida's Citrus Industry

The citrus tree is a native of the Orient. From this area it was carried ever westward by man, to India, to the Mediterranean and on across the Atlantic. Citrus was brought to the Americas by Columbus. When he landed on November 22, 1493, he brought citrus seeds that were planted on the island of Haiti. The first seeds planted on the mainland of the Americas were brought by the expedition of Juan de Grijalva when he landed in Central America between July 12 and July 20, 1518. The exact date of the introduction of citrus trees into Florida is not known, but from a statement made by Pedro Medendez, dated April 2, 1579, it appears that citrus fruits were grown in abundance around St. Augustine at that time. Early settlers in Florida some two centuries later found wild citrus trees scattered over the state. One of the oldest, cultivated groves planted in Florida (Hume, 1926 p. 95) is thought to be the Don Phillipe grove in Pinellas County, planted some time between 1809 and 1820.

Citrus production in Florida had reached an all time high of more than 5 million boxes when the Great Freeze of 1894-95 almost totally wiped out the citrus industry. It was not until 1909-10 that this level was reached again. Since that time the volume steadily increased. As the decade of the seventies began, Florida's dominance of the Nation's citrus became even more apparent. In 1982-83, Florida had 63.2 percent of the Nation's production.

Footnote 2/ for page 32, 1/ for pages 33 and 34. Final Mexican shipments to the U. S. are reported by FAS as a combined total for oranges and tangerines. The total shown on pages 32 through 34 has been broken down proportionally into oranges and tangerines from Plant Quarantine data reported at the time of the crossing. Plant Quarantine releases give separate totals for these two types of citrus. Mexican shipments exclude Canadian shipments.

ACKNOWLEDGMENT

The acreage, production and value statistics in this bulletin are official state and USDA estimates prepared by the Florida Crop and Livestock Reporting Service. The county and area detail were made possible by the participation of the Department of Food and Resource Economics, University of Florida, in the estimating program. The Bureau of State Markets, Florida Department of Agriculture, and the County Extension Agents, University of Florida, Cooperative Extension Service, were also very helpful in supplying area and county information. Shipment statistics were provided by the Market News sections of the Florida Department of Agriculture and the USDA Agricultural Marketing Service.

Grower organizations have provided valuable assistance and data throughout the season. These groups include the Florida Celery Committee, Florida Tomato Committee, Florida Sweet Corn Exchange, South Florida Vegetable Exchange, Zellwood Sweet Corn Exchange, and North Florida Growers Exchange. Sales agencies and transportation firms provided the inputs necessary to complete the statistical story.

Foremost, the growers, shippers and processors volunteered most of the basic data used in developing these official statistics. The public spirited cooperation of these individuals and groups is appreciated.

Fieldmen James Spires, Immokalee; Charles Robertson, Homestead; Wallace Jacobs, North Palm Beach; and Larry Amlong of Palmetto collected much of the basic acreage, production and price statistics in this bulletin. This report was assembled under the direction of Ron Shannon, Gerald H. Moody and Carl A. Ouzts of the Florida Crop and Livestock Reporting Service and E. F. Scarborough, Bureau of Market News. The authors also wish to thank Becky Altman, Diana Clingan, Ray Crickenberger, Marcelo Diaz, Kitty Hildreth, Barbara Palmer, Tommy Scherer, Cindi Shope, Pat Todd and others of the Florida Crop and Livestock Reporting Service who assisted in compiling and preparing this report.

Summary of Shipments by Crops, by Months, 1982-83	--	--	48	--

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPS–During the growing season, estimates were prepared for most crops on a six month seasonal group basis. The periods are for the crop year July-December and January through June. The two six month periods were combined in this publication into a crop year total for all crops. Production sold or utilized is shown by months.

PLANTED ACREAGE is the total acreage which has been planted for harvest during the crop year. Acreage lost and replanted to the same crop in time for harvest in the same quarter is counted only once. Acreage harvested and planted again to the same crop is counted twice.

HARVESTED ACREAGE is the acreage partially or completely harvested. Acreage lost before or at maturity through natural or economic causes is not included in the acreage for harvest.

YIELD is the average production per acre of merchantable quality harvested and sold or utilized.

PRODUCTION is the quantity actually harvested and sold or utilized.

UNIT VALUE for fresh market sales is the equivalent price received, f.o.b. shipping point basis and encompasses all grades and sizes marketed or utilized. Included are packing charges, selling charges, precooling, top ice, or other costs which contribute to the value of the product at shipping point. The value per unit for quantities sold to processors is the average value paid for usable quantities, on a "delivered to plant door" basis. This value includes transportation and other normal costs incident to delivery at plant door.

TOTAL VALUE is the equivalent value of production sold or utilized based on the unit value. Cullage and other quantities not sold or utilized because of natural or economic factors are excluded.

OTHER COUNTIES include harvested acreage for all counties for which either published data would result in the disclosure of individual operations or acreage totals for specific commodities are of minor importance in the state.

All shipments and unloads, rail, truck, air and boat, are recorded nationally in 10,000 pound units each day. Annual releases are in 1,000 cwt. In this publication, shipments and unloads for some commodities were converted to most common trading units. Rail and piggyback weights and conversion factors were determined by several Market News Service field offices. Mixed car (rail) loadings by stations have been prorated by commodities.

Where possible, the national Market News Service in Washington, D. C. has established a single uniform weight per commodity to be used nationally in converting to weight units for the various means of transportation. Weights per common container used and number of units per rail car or truck may be obtained by writing the MNS office in Winter Park, Florida.

PRODUCTION AND PRICE UNIT–The official USDA vegetable crop estimates are published on a weight basis. For this bulletin, the official estimates for most vegetable crops have been converted to what is believed to be the most commonly used containers. If changes in container weights are necessary, all data pertaining to the production of the commodity in question is revised to maintain comparability between years. The table below gives the net weight used per container and the number of containers per hundredweight.

PRODUCTION AND PRICE UNIT

Most common unit,estimated net weight, number of units per hundredweight, principal vegetable commodities, Florida, 1982-83 crop season

Commodity	Unit	Est. net weight	No. of units per cwt.	Commodity	Unit	Est. Net weight	No. of units per cwt.
		Pounds				Pounds	
Snap Beans	Bushel	30	3.333	Lettuce	Cwt.	100	---
Cabbage	Crate	53	1.887	Green Pepper	Bushel	25	4.000

SUMMARY OF THE 1982-83 VEGETABLES SEASON

The farm value of Florida grown vegetables, melons, potatoes and strawberries sold in the 1982-83 crop year totaled $1.1 billion, up $164 million from the 1981-82 crop year. Acreage harvested was 4 percent above the previous year. Crops showing the greatest gains in harvested acres were carrots, sweet corn, watermelons, cabbage, green peppers, lettuce, tomatoes and strawberries. Crops increasing in value were snap beans, celery, sweet corn, cucumbers, green peppers, radishes, squash, tomatoes, watermelons and strawberries. Crops with lower values than the previous year were cabbage, carrots, eggplant, escarole, lettuce and potatoes. Most of the declines were due to lower season average prices. Tomatoes, which rose $124.3 million, showed the greatest increase in value, followed by green peppers which increased $34.1 million; celery, $16.2 million; squash, up $4.9 million and snap beans, up $4.5 million from a year ago. Cabbage and lettuce showed the greatest declines, down $10.9 million and $10.5 million, respectively, from the previous year.

Average yields for cabbage, carrots, celery, snap beans, cucumbers, eggplant, escarole, lettuce, green peppers, radishes and squash increased during the year but yields declined for sweet corn, potatoes, tomatoes and strawberries.

Season average prices for celery, sweet corn, snap beans, cucumbers, green peppers, potatoes, radishes, squash, tomatoes and watermelons were higher than a year ago. Prices for cabbage, carrots, eggplant, escarole, lettuce and strawberries averaged below the previous season.

Land preparation, planting and transplanting were active in most areas of the state during July. Growing conditions were generally good to excellent over most of the farming areas during August. Planting activity progressed favorably. Showers and thundershowers were frequent the last of September and early October. Heaviest rains occurred in the west central area with some local crop damage reported. Numerous cold fronts during much of October and November interrupted planting and harvesting activities.

Temperatures were generally mild during most of December. A cold front entered the farming areas in late December, lowering temperatures into the 30's. The front was accompanied by light, scattered frost. Extensive leafburn occurred to tender cucumbers in the southwest and plant growth was slowed on most crops.

Much of January was characterized by numerous cold fronts and temperatures in the 30's and 40's. Light frost and cold winds caused light to moderate top foliage burn to tender crops. A cold front at month's end was accompanied by moderate to heavy showers and strong winds. Rainfall amounts were significant, especially over south Florida, varying from 2 to 7 inches.

Unusually wet weather was predominant during February. Many sections of the state had more than double the normal rainfall. Field work was delayed by the very wet conditions. The adverse weather caused some wind and water damage to the vegetable areas.

A two-month-long period of below normal temperatures and above normal precipitation continued in March. Very strong, gusty winds accompanying the showers at month's end caused some plant damage. Some locally serious crop damage due to heavy hail was reported in Hillsborough County.

Sunny skies with warm days and mild nights dominated the first half of April in the vegetable areas. A cold front at midmonth brought cooler temperatures and showers. Record low temperatures were set over south and central Florida, April 25. Overnight records were in the 40's in north Florida and 50's in the south. Winds were light to moderate for the month.

The month of May was characterized by fair, dry weather with warm days and mild nights. Rainfall was spotty with many areas receiving little or no rain. Irrigation was very active to maintain soil moisture. Widespread rains beginning on May 29 were very beneficial as very little rain occurred during the month. Rainfall averaged 1-2 inches in central and southern areas and up to 3 inches in the lower southeast. Harvest was very active for some vegetables while declining for others.

In June, the weather was generally normal over most of the vegetable growing areas. Moderate to heavy thundershower activity occurred almost daily, but rainfall was variable by areas. Daytime highs were mostly in the 90's with nighttime lows in the 70's. Winds were light to moderate, gusty near showers. Crops were generally fair to very good in most areas.

Most of the weather data for this summary was supplied through the National Weather Service, U. S. Department of Commerce, Ruskin, Florida. Information on the effects of weather on crops was provided by the Florida Crop and Livestock Reporting Service fieldmen.

SNAP BEANS
1982-83

Florida growers produced 4.2 million bushels of bush and pole beans during the 1982-83 season for fresh and processing utilization, up 5 percent from a year earlier. Acreage harvested for fresh and processing totaled 47,000 acres, down 3 percent from the 48,300 acres harvested during the previous season. The average yield for the 1982-83 season was 90 bushels per acre for fresh market and 100 bushels per acre for processing, as compared with 82 bushels and 100 bushels, respectively, for the previous year.

The average f.o.b. price of $10.60 per bushel for fresh market was 27 cents higher than the previous year. At $3.00 per bushel, snap beans for processing remained at the same price as the previous season. Total value, at $44.1 million, was 11 percent above last year.

Bush beans are grown in all areas of Florida with the exception of the east central and southwest areas. The southeast continues to be the major producing area. Pole beans are grown primarily in Dade County, with small acreages in Gadsden and Marion counties and the west central area.

Earliest fall supplies of snap beans originate from west Florida. The northern and west central areas, the Everglades and southeastern districts also provide fall production. The southeast is the sole source of supply during the winter. The other areas resume production in the spring.

Snap bean production extended from early October into mid June. The fall crop peaked in December. Marketings declined sharply in January and February. Production began to increase in March, and the spring crop peaked in April. Seventeen percent of the marketings occurred in April.

Wet weather adversely affected the 1982-83 bean crop. Heavy rains in late September, early October and November washed beds and leached fertilizer, necessitating reseeding in some areas. During the winter season, unusually heavy rains washed beds, delaying planting and harvesting activities. The wet fall and winter resulted in below normal yields and quality. Heavy rains during March continued to delay harvesting in the Pomapno area; however, weather the remainder of the spring was near ideal for beans. Quality and yields were generally good for the spring season.

CABBAGE
1982-83

Florida growers produced 6.4 million crates and bags of cabbage during the 1982-83 season. Production at this level is 10 percent more than the previous year. The gross value was $22.7 million, a 33 percent decline from the previous year's total of $33.6 million. The average f.o.b. price was $3.52 per crate or bag, down $2.23 from the $5.75 received for the prior season's crop. The sharp drop in the average price received accounted for the big decline in value.

Total plantings were 16,300 acres, down 1 percent from the 16,500 acres planted during the 1981-82 season. A total of 14,700 acres were harvested, nearly 4 percent above the previous season. The average yield of 438 crates or bags per acre was up 27 from the season before.

Cabbage was available for market by late October and continued through June. Production during the fall months was down 14 percent from the previous fall. Production during the winter and spring period was up 13 percent from the year before. The peak months were February and March followed by April.

The Hastings area, which includes Flagler, Putnam and St. Johns counties, continued as the leading producing area. These counties accounted for 61 percent of the state's total production during the 1982-83 season. St. Johns County was the leading cabbage producing county in the state with 31 percent of the total acres harvested.

Planting was underway during late August and progressed rapidly into September. The most active period was October through December but continued into February. Transplanting is the main method of planting cabbage. There is still some interest in planting seed direct in the field but this method accounts for a very small portion of the total acreage planted.

Harvest began in late October, increasing slowly into December. Cutting picked up sharply in January, leveled off during February and March and then started to decline in April. There were no killing freezes during the winter and this period accounted for 56.7 percent of the total production. The spring months accounted for 36.3 percent of the total cabbage produced.

CARROTS
1982-83

Production of carrots in Florida for fresh market and processing utilization during the 1982-83 season totaled 1,100,000 cwt., up 19 percent from the previous season. Fresh use constituted 80 percent and processing 20 percent. This is the same as the previous year. Approximately 19 percent of the fresh carrots were mini or finger carrots compared with 21 percent a year earlier. The remaining 81 percent were the regular type carrots.

There were 10,000 acres harvested from the 10,600 acres planted during the 1982-83 crop year. This compares with 9,400 acres harvested from 10,500 acres planted a year earlier. Average price received for the 1982-83 crop was $10.50 per cwt. compared with $14.30 per cwt. the previous year. Total value was $11.6 million, down 12 percent from the $13.2 million for the 1981-82 crop year.

The muck soils around Lake Apopka, near Zellwood and the Everglades, provide a good medium for growth. By far the majority of carrots are grown in the Zellwood area. The mini or finger carrot movement usually begins in late October or early November and ends by late May. Regular size carrots are harvested from November through June. The young carrots are subject to cold in January and February each year in the Zellwood area. Size and quality were good throughout the season.

CELERY
1982-83

Florida celery marketings of 6.3 million crates were harvested from 9,400 acres during the 1982-83 growing season. The average yield of 666 crates per acre compares with 537 crates the previous year.

Prices averaged higher than the previous year and at $8.77 f.o.b. per crate, compared with $7.58 per crate during the 1981-82 season. Prices during April, May and June averaged higher than the same months the previous year while prices during November through March averaged lower than the previous year.

The Everglades, with 85 percent of the harvested acreage in the state, was the foremost area of production throughout the season. The north central area supplemented by a light supply from the Sarasota area, accounted for the remaining 15 percent of acreage and provided continuous supplies during the season.

Plant bed preparation and seeding were underway by mid June. Transplantings were gaining momentum by late August and became active in September. Transplantings in the Everglades were interrupted by frequent rains during February. Plantings in the Everglades were winding down by the end of March and were complete by early April. Transplantings were complete in the central area in early May. Growers in the Sarasota area normally plant from October to March.

Light harvest began in early November in the Zellwood area and by mid November in the Everglades. Growing conditions were hot and humid in the summer and early fall months. The leaf miner was a problem in December, but effective spraying brought it under control. Cool weather during December and January was beneficial for growth and development. Quality was good early in the season and then improved from good to very good as the season progressed. Overall yields were about 24 percent above a year earlier.

No significant damage occurred from cold fronts moving into celery growing areas. The midwinter market was on the weak side but prices improved sharply during April, May and June. Prices averaged above year earlier levels. Approximately 3 percent of the crop was not harvested for various reasons. Growers passed some acreage in order to maintain good quality.

Celery production was most active December through May with May being the peak month. Cutting was completed in all areas by mid July.

Celery is subject to a federal marketing order administered by the Florida Celery Committee. Field supervisors provided the basic acreage and production data. In cooperation with the Celery Committee, these data are assembled into weekly, monthly and annual reports and published in this Annual Summary.

CHINESE CABBAGE
1982-83

Chinese cabbage is grown primarily on the mucklands of the Zellwood and Everglades area. The organic soils provide a very good medium for rapid growth. Harvest was underway by late November and reached a good volume in December. Production reached a peak level in January. Good volume continued through May.

During mid April, Zellwood was providing a good volume while the Everglades was declining seasonally. The season was over by June 1. Quality was mostly good throughout the season. No significant cold damage occurred. Shipments for the season totaled 129,000 cwt. compared with 100,000 cwt. a year earlier.

SWEET CORN
1982-83

Florida, the Nations's leading sweet corn producer for fresh sales, marketed 11.3 million crates during the 1982-83 season. Production increased 5 percent from the previous year. Harvested acres totaled 57,700 compared with 50,100 harvested the previous year. Yields averaged 196 crates per acre statewide compared with 215 crates per acre a year earlier. Heavy rains throughout the growing season reduced average yields to lower than normal levels in most areas. This is the first time since the record 244 crate average in the 1972-73 crop year, that the yield has averaged below 200 crates.

The season average f.o.b. price of $5.74 per crate was 6 cents more than the $5.68 per crate average in the 1981-82 crop season. The value of sweet corn ranked third in the state in vegetable crops and was exceeded only by the value of tomatoes and green peppers.

First plantings of the season were underway in the Everglades and Zellwood areas in July. Seeding along the southeast coast got underway in early October. First harvest began in the Zellwood area after mid September. The crop in the Everglades was slowed by heavy rains. Harvest got underway by mid October and reached a peak in November. Harvest shifted from the Everglades to the southeast coast in December. By mid January Dade County began light harvest.

Harvest of the spring crop in the Everglades was underway by mid April. The Everglades became the main source of supply in late April as the East Coast and Dade County were nearing the end for the season. Spring harvest got underway in late May in the Zellwood area. Supplies declined seasonally in the Everglades by early June and the Zellwood area became the main source of supply into early July. The season was over by mid July.

A small acreage continued to provide supplemental supplies from Zellwood and the west central area during the early fall and from Sarasota in the early spring.

Weather was marked by heavy rains throughout most of the growing season. The rains interrupted plantings, washed beds and leached fertilizer in most areas. Yields were reduced by the adverse conditions. Quality and ear size were variable as the season progressed into late winter and early spring.

CUCUMBERS
1982-83

Florida's production of cucumbers for fresh market during the 1982-83 crop year was 4.7 million bushels, remaining even with the 1981-82 crop. The 15,900 acres planted for fresh market was down 200 acres from the previous year. Fresh market harvested acres totaled 15,000, a decrease of 300 acres from a year earlier.Average yield per acre for fresh market, at 316 bushels, was up 8 bushels from the previous season. Total fresh market production was valued at $37.0 million compared with 33 million for the 1981-82 season. The fresh market price for 1982-83 averaged $7.77 per bushel compared with $7.00 the previous year.

Supplies in 1982-83 were generally available from October through June, with light marketings January through March. Many of the recorded shipments moving out-of-state January through March are from offshore and truck imports resold in mixed loads.

The production of cucumbers is well distributed across the state. The southwest area, with 39 percent of the planted acreage in 1982-83, is the largest area. The west central area accounted for 33 percent of the acreage in the state. The west, north, north central, and the southeast areas provide the remaining acreage.

The crop was in mostly good condition during late fall and winter but heavy rains caused some damage to fields in September. Strong, cold winds in late December slowed growth in the Pompano area. February was marked by strong winds, cold temperatures causing some burning and discoloration of leaves. Heavy rain in March was accompanied by strong winds that whipped plants causing leafburn and scarring of fruit. Poor weather restricted planting in the west central area. Conditions for the spring crop were mostly good although the season got off to a poor start due to adverse weather. Fruit quality, color and size were mostly good in the fall and winter but variable in the spring. Yields were variable most of the season.

EGGPLANT
1982-83

Plantings totaled 2,590 acres, down 2 percent from the 1981-82 season. Yields averaged 666 bushels per acre compared with 657 bushels for the previous season. Weather was generally favorable during much of the growing season. However, during early November, crop condition was lowered by heavy rains and strong winds. In mid February, strong winds whipped plants and scarred fruit. Growing conditions during the spring quarter were very good but plant size was smaller than normal. Fruit quality, color, size, and yields were mostly good.

Production of eggplant, at 1,666,000 bushels, was slightly above last year's production. Total sales decreased to $8.4 million compared with $9.6 million a year earlier. The decrease was due to a low price per bushel in the fall quarter because yield per acre and harvested acres were unchanged from 1981-82. The season average price of $5.06 per bushel is 70 cents lower than a year ago. Compared with a year earlier, prices for most months were higher in the spring but lower in the fall and winter.

The distribution of marketings was generally normal. Harvest began in late September, reached a peak in November and dropped during the winter. Harvest began to increase in April and reached a peak in June. Harvest was virtually complete by July. The southeastern area around Pompano accounted for 55 percent of the harvested acreage. The northern and central areas combined contributed about 39 percent of the acreage harvested with the remaining acreage in the southwest.

Production is generally continuous throughout the entire crop year in the southeast and southwest. The crops in the western, northern, and central areas are for fall and spring harvest only because these areas receive too much freezing weather to grow eggplant during the winter months.

First sales were from cuttings in the western and northern areas in late September. Harvest followed the usual pattern and progressed southward in the fall, continued through the winter in the southern areas, and then moved back northward in the spring.

ESCAROLE-ENDIVE
1982-83

Production of escarole and endive during the 1982-83 season totaled 2.9 million crates, up 7 percent from a year earlier. The 5,600 acres harvested were up 6 percent from the previous year. Yield per acre averaged 519 crates compared with 512 crates the previous year.

Prices during the season averaged $5.17 per crate, compared with $6.65 a year earlier. Prices were lower than a year earlier in every month of marketings except March and April. Total value of sales, at $15.0 million, was 17 percent below the previous year. The Everglades, which had 69 percent of the harvested acreage in the 1982-83 season, began seeding in late August. Weekly plantings continued through March. Light harvest began in early November and was continuous into early June, The mucklands around Zellwood provided good volume in the late spring months. The small acreage grown around Lake Placid and Sarasota mucklands furnished supplemental supplies during much of the season.

Sales started slowly in late October and increased to good volume by mid November. Marketings reached peak levels in the December-through-May period. Sales were complete for the season by mid June.

Growing conditions were generally favorable during most of the season. However, rains during late February and early March interrupted harvest activity. Some light cold damage to outer leaves occurred in early January. Quality of escarole and endive was mostly good throughout the season.

LETTUCE
1982-83

Florida lettuce growers produced 2.5 million cwt. during the 1982-83 season, up 9 percent from the previous year. A 5 percent increase in harvested acreage along with an increase of 7 cwt. per acre contributed to the increase in production. Average yield of 190 cwt. per acre compares with 183 cwt. per acre for the previous season. Growers harvested 12,900 acres compared with 12,300 acres the previous year. The season average f.o.b. price of $18.83 per cwt. was below the $25.16 per cwt. received the previous year. Monthly prices through April were below a year earlier. Prices during the winter quarter were well below the previous winter.

Acreage, production and value statistics of lettuce in this bulletin combine the various types into a single estimate. The types in order of importance include iceberg, romaine, Boston, bibb and leaf.

The Everglades muckland accounted for 86 percent of the planted acreage and was the source of a continuous supply of good quality lettuce which began in late October and early November and continued through May. Outside the Everglades, Zellwood is the other major producing area, with Sarasota and the Lake Placid mucksoils contributing light supplies during most of the season.

Seeding was underway in late August. All areas were actively planting by late September. The Everglades and Sarasota areas had continuous plantings through March.

Very light harvest of specialty types was underway by late October and continued light until mid November. Volume gained significantly in December and continued heavy through May. The Everglades continued to provide the bulk of the volume during the winter period. Virtually all of the iceberg type is grown in the Everglades. Harvest was completed in all areas by late May. Volume from the Zellwood area was light during the winter months. Moderate supplies are available from this area during the fall and spring seasons.

Growing conditions in the early fall were hot and humid. Frequent rains interrupted cutting for several days in late January. Growth was generally very good. Heavy volume was available statewide during April and May. Quality was generally good throughout the season.

PEPPERS
1982-83

Florida produced 9.5 million bushels of peppers during the 1982-83 season, an increase of 20 percent from the previous year. The average yield of 482 bushels per acre was 17 percent above the 412 bushels per acre last season. Harvested acreage, at 19,700 acres, was 2 percent more than the 19,300 acres harvested in 1981-82.

The season average f.o.b. price of $9.45 per bushel was up from an average of $7.00 for the previous season. The total value of $89.7 million was 61 percent above the previous year. Prices were above last year except for October through December. Prices in January through April were well above the previous year. Marketings were light in October but increased to a good level by December. Supplies decreased slightly in February and March but began an upward swing in April. The peak spring production occurred in May. The season then declined and was mostly over by the end of June.

Total planted acreage remained about the same as the previous season. Increases in acreage for the west central and southeast areas were offset by decreases for the north central and southwest. The acreage in the north area did not change from the previous year. The important southwest area accounted for 37.5 percent of the state's total pepper acreage. The southeast had 34.8 percent; the west central area, 9.5 percent; the north area, 9.3 percent; and the north central area, 8.8 percent.

Heavy rains during late September necessitated resetting in some fields to restore normal stands. Peppers suffered somewhat from the rains, but most beds were plastic covered and received little damage. Rains again in the winter and spring caused some leaching of fertilizer and a delay in harvest. Crop condition in the spring was generally good despite the wet weather. Yields were good.

POTATOES
1982-83

Potato production in Florida during 1983, including both winter and spring crops, totaled 5.8 million cwt., 13 percent less than the 1982 crop. A total of 30,600 acres were planted for 1983 harvest. Out of this total, 29,800 acres were harvested, less than 1 percent below the acreage harvested in 1982. The value of the crop was placed at $54.4 million–down 10 percent from the previous year. The decline in value was due to the drop in production. The average price received for all potatoes was $9.30 per cwt., up 35 cents from the year before.

The average yield for all seasons combined was 196 cwt. per acre. In the Hastings area which includes Flagler, Putnam and St. Johns counties, the average yield was 215 cwt. per acre, down 25 cwt. from last year. Spring potatoes grown in other areas of the state had an average yield of 155 cwt. per acre. This was a sharp drop from the 210 cwt. average of 1982. The average yield for the 1983 winter crop--140 cwt. per acre–was down sharply also, and the lowest since 1972. The lower yield was caused by flooding of fields early in the season.

The dominant varieties grown in south Florida are red skinned. Most of the winter production is sold on the open market and used as table stock. In the Hastings area the white skin varieties are the most important. Most of the Hastings production goes to the potato chip industry, although, fresh market or table stock sales are increasing in importance.

The winter crop harvest got underway in late January. Harvest was most active during March and April. Digging of the spring crop started at the end of April and was most active during May. Harvest was completed in June. Acreage abandonment was considered normal and was caused by flooding of low areas during the early growing season.

SPINACH FOR PROCESSING
1982-83

Spinach statistics have not been published separately for Florida since 1973 in order to avoid disclosure of individual operations. However, data since then have been included in the "other vegetable" series shown in this publication. Yields per harvested acre averaged slightly below a year earlier. Most of the crop is grown in the north central area.

SQUASH
1982-83

Florida's production of squash during the 1982-83 season, at 2.9 million bushels, was 3 percent above last year. The total of 16,100 acres harvested decreased 3 percent from the previous year. The yield, at 179 bushels per acre, was up 11 bushels from last year.

The season average price of $11.12 per bushel was up $1.43 from the 1981-82 season. Total cash receipts amounted to $32.0 million. Monthly prices were above a year earlier except for October and December.

Florida produces acorn, butternut, yellow crookneck, yellow straightneck, white, and zucchini squash. Dade County, with 28 percent of the state's harvested acreage in 1982-83, produces yellow crookneck squash almost exclusively. The Pompano area, in addition to being a major producing area, is also an important market for squash grown in other areas of the state. This is especially true when local supplies reach low levels during the winter months. The southwest area produces a continuous supply of most types. Central, north, and west Florida provide a good volume of most types during the fall and spring season.

Squash is one of the few crops grown in Florida that is shipped every month of the year, although shipments during the summer are light and mostly confined to local markets. The 1982-83 season got off to a fair to good start as heavy rains caused some minor problems. Marketings increased to a fall peak in November, before showing a seasonal decline during the winter months. Cold winds and scattered frost in mid January caused light to moderate windburn on foliage. Pompano was hit with heavy rains in February and March. Rains washed beds, leached fertilizer and lowered plant condition. Weather was favorable during the spring quarter, and production was heavy. Peak marketings for the season occurred in May.

RADISHES
1982-83

In the 1982-83 crop year, radish plantings amounted to 27,400 acres compared with 27,700 acres planted during the previous year. Acres harvested totaled 24,700, 1 percent above the 1981-82 season. Yield per acre averaged 247 compared with 240 cartons a year earlier. The crop was valued at a record $27.9 million, up $4.1 million from the previous record a year earlier. The average f.o.b. price was $4.58 per carton, up 53 cents from the 1981-82 season.

A good supply of both red and white radishes was available from Zellwood, Lake Placid, and the Everglades from October through June. The peak fall harvest occurred in November. The spring peak occurred in April. Seeding of the 1982-83 crop was underway in the Everglades and the north central areas in early September. Light harvest was underway in early October and became quite active in mid November. Heavy rains interrupted digging in February. Supplemental supplies were available from Lake Placid and Sarasota during the year.

STRAWBERRIES
1982-83

Florida strawberry growers produced 8.6 million flats of berries during the 1982-83 season, up 5 percent from the previous year. Harvested acreage totaling 5,400 acres increased 8 percent from the previous year. Yields per acre averaged 1,583 flats compared with 1,625 flats the previous year. While yields were lower than the previous year, they have increased dramatically in recent years. High yielding and early maturing varieties have been introduced in the Hillsborough-Manatee area in recent years. The f.o.b. return per flat for the season was $6.14, a decrease of 30 cents per flat from the previous season. The value of the crop was $52.5 million, about the same as a year ago.

Laying of plastic and other field work were in full swing by late September and transplanting was very active by mid October in the important Hillsborough-Manatee area. Transplanting was complete by mid November. Some scattered blooms on early plantings occurred in late November and light harvest was underway by mid December. Picking increased and shipments got underway in January. Peak movement occurred in April. Most of the commercial harvest was completed by late April. U-Pic harvest continued active during May. Plant growth was good. Heavy rains in February and March damaged mature berries and delayed picking. Volume was up sharply by mid March. Quality and size were very good. Harvest was underway in Bradford County by mid March and the season was drawing to a close around late May. Most of the acreage in Dade County was for U-Pic and roadside stand operations.

TOMATOES
1982-83

The total value of the Florida tomato crop including fresh market and processing was $390.6 million–up nearly 47 percent from the 1981-82 season. This was a record value for the state. The higher value for the crop can be attributed to a higher price per crate and a sharp increase in acreage harvested.

Total production of 54.1 million 25-pound carton equivalents was up 3 percent and a new production record for the state. Tomatoes utilized for the fresh market amounted to slightly over 97 percent of the total while the remaining 3 percent went to processors. The processing segment is a secondary utilization, usually following the fresh market harvest. The Palmetto-Ruskin area accounted for 39.5 percent of the total production and Dade County 28.4 percent. The southwest had 21.7 percent, Ft. Pierce-Pompano, 6.3 percent and the remaining 4.1 percent was produced in the north, north central and western areas of the state.

The average yield for the state was 1,154 (25-pound) cartons, down 96 cartons from the 1981-82 season. Demand for Florida tomatoes remained strong during the season. Harvest continued into July. Both the winter and spring production were near normal. Heavy rains and a cool spring reduced yields on the early spring acreage. However, a longer than usual harvesting period helped to keep yields up some. Dade County continues to be the major winter producing area. Fall production was up from the year before due to an increase in acreage as yields were down slightly. January was the peak month during the winter, accounting for 13.9 percent of the year's total while May was the peak month in the spring, accounting for 16.8 percent of the total.

The Palmetto-Ruskin area was the acreage leader with 17,200 acres harvested followed by Dade County with 12,900 acres. The southwest area had 10,400 acres harvested and the Ft. Pierce-Pompano area harvested 3,000 acres. Gadsden County, with 1,200 acres harvested, accounted for the largest portion of the state's remaining acreage.

Planting got underway in the Palmetto-Ruskin area in July. All other areas started shortly afterwards except Dade County where planting begins in September. Harvest got underway in October and continued into early July in the southern areas. Light harvest continued through July in the other areas.

WATERMELONS
1982-83

Total plantings of watermelons amounted to 59,000 acres during the 1982-83 season. This was an increase of 5 percent over the 1981-82 season. Of the total planted, 49,000 acres were harvested, up 2 percent from the previous season. Abandonment continued to be very high due to weather related problems and market fluctuations during the season. Production was placed at 8.1 million cwt., up 2 percent from the previous season. The average yield was 165 cwt. per acre, the same as last year. The yields by areas were rather variable, ranging from 134 cwt. in the Panhandle to 190 cwt. in the south.

The average price was a record $7.20 per cwt. up 30 cents from last season. Prices received by growers were the highest in the south and central areas where harvest begins early. The total value of the crop was placed at $58.2 million, a new record for the state. This was nearly 7 percent above the previous record set last year.

The watermelon harvest did not get underway until May and was very active during June and July. The season was delayed by a cool, wet spring which extended into the southern portion where the early harvest begins. Price was very good for early melons and held up a little longer than usual.

There is a small acreage of fall grown watermelons in the south and scattered central areas. These melons are harvested in November and December, depending on weather conditions. This acreage and production are included in the following spring crop. The usual harvest begins in April in the south. The harvest progresses northward in the central areas during May, through the north during June and usually ends in the Panhandle during July.

First plantings are in the southwest in late December or early January. Cool, wet weather slowed seed germination and some fields had to be replanted because of poor stands. The cool weather continued into the spring months.

Harvest did not get underway until late May but moved rapidly and peaked in June. Harvest continued active through most of July. The season was over by very early August.

OTHER CROPS
1982-83

Cantaloups are grown in Florida primarily in the southwest and north central areas. Much of the production is sold through roadside stands and local markets. The peak harvest period is normally May and June. Harvest begins in the southwest and progresses northward seasonally. There are some cantaloups grown during the fall months in the southwest and west central areas. Acreage continues at a relatively low level. However, this crop is not part of the regular program for vegetables and melons. Researchers continue to work toward developing new varieties that will be better adapted to Florida's soils and climate. There appears to be some promise that acreage may expand in the future.

Cauliflower is grown in the Zellwood, Hillsborough-Manatee and Everglades areas. Acreage increased from a year earlier. Supplies are available from December to April. At the present time statistics are not available for publication. Shipment information is recorded by Market News Service. In the 1982-83 season there were 86 thousand cwt. (391 thousand 22-pound cartons) shipped out of the state compared with 52 thousand cwt. shipped the previous season.

Tropical vegetable production during the 1982-83 season decreased slightly from the previous year due primarily to an above average water table in 1982 that reduced the yield. By far the majority of the acreage is grown in Dade County. Commercial production began in the early 60's. Tropical vegetables is a colloquial expression applied to certain vegetables eaten primarily by those of Latin American and Caribbean origin. The most common name for each crop followed by the scientific name is listed below. Other common terms for various vegetables are shown in parenthesis. The crops consist primarily of boniato-Ipomea batata (sweet potato); calabaza-Cucurbita (pumpkin); malanga-Xanthosoma caracu or Colocasia esculenta (dasheen, vautia); and cassava-Manihot esculenta (crantz, yucca topioca). The boniato, Calabaza and Malanga constitute the bulk of the production . The Dade County Agricultural Extension Service reported 11,400 acres of tropical vegetables planted in the 1982 calendar year. Peak production of malanga occurs in February through April. Efforts are underway to even out the supply throughout the year. Available land continues to be a limiting factor for all agricultural production in Dade County. New varieties of calabaza are being brought in from Columbia, South America to select those that do best in south Florida. Miami is an important point of consumption for the Florida production. Also, considerable amounts are consumed in the Tampa Bay area. The supplies shipped out of the state are primarily for the New York City and Philadelphia areas.

Collard, turnip, mustard and other greens are grown thoughout the state and centered around large population areas and in the muck soils of the Everglades and Zellwood areas. Good volume is available November through March. Shipments totaled 42 thousand cwt. during the 1982-83 season, 15 thousand cwt. less than a year earlier.

Okra is grown in many areas of the state during the warm season of the year. However, Dade County produces okra for local use as well as for shipments to other states. Peak production takes place in May and June with a good supply in October and November.

Green Onions and leeks are produced in the north central area. Supplies are marketed primarily for local use at roadside stands and markets. There are several large producers who ship to other states. Supplies of dry onions are limited. Most of the dry onions are produced in southern and west central areas of the state.

Parsley is available in both the curley and plain types. The bulk of the commercial volume shipped to other states is produced in the Everglades and Zellwood areas. Light supplies sold for local use are available from the Sarasota, Lake Placid and other areas.

Southern peas are grown primarily in the northwest, west central and Everglades areas of Florida. Dade County also produces a considerable amount of southern peas. Light supplies are available from September through December. Heavy movement occurrs in May and June, especially in northwest Florida. A high percentage of the crop is utilized for processing. Good supplies are sold through local markets for fresh use. Market News Service shipment statistics for out-of-state markets show 23 thousand cwt. for fresh market during the 1982-83 season.

Watercress is available the year around. The major source of supply is the Oviedo area. Most of the production is shipped to northern and eastern markets in the United States. A limited supply is available from local state farmers markets, especially in the Sanford area.

VEGETABLES, MELONS, POTATOES AND STRAWBERRIES: ACREAGE, YIELD, PRODUCTION AND VALUE, FLORIDA, CROP YEARS 1981-82 AND 1982-83

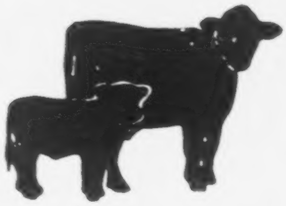
Florida Agricultural Statistics



Livestock Summary 1983

FLORIDA CROP AND LIVESTOCK REPORTING SERVICE
1222 Woodward Street, Orlando, Florida 32803

DOYLE CONNER
COMMISSIONER

THE STATE OF FLORIDA
DEPARTMENT OF AGRICULTURE
THE CAPITOL
TALLAHASSEE
32304

Dear Friend:

A vital ingredient in an effective production and marketing program for any agricultural commodity is the availability of current, unbiased and accurate information in a usable form. The livestock statistical data in this publication help meet this need.

Florida's livestock industry is an important component of our total agricultural sector. Nationally, Florida ranks ninth in beef cows and first among states east of the Mississippi River. Nearly 530,000 feeder calves were shipped to 31 states from east and south of the Suwannee River during 1983.

I thank all of the voluntary reporters who supplied the basic data for this publication which was compiled through the cooperation of the Florida Department of Agriculture and Consumer Services and the U. S. Department of Agriculture.

Sincerely,

Doyle Conner

ACKNOWLEDGMENT

Many livestock producers and ranchers, slaughterers, auctions, feed lots, and other agencies associated with the livestock industry offered suggestions or voluntarily supplied basic data used to develop these statistics. Their contributions are sincerely appreciated.

The inventory, production, slaughter, utilization, monthly and annual average price, and livestock value statistics for Florida are official State and USDA estimates prepared by the Crop and Livestock Reporting Service. Corresponding data for other livestock producing States are from official reports of the USDA Statistical Reporting Service. Information on shipments, auction market prices, and special feeder sales are from cooperative work between the Florida Department of Agriculture and Consumer Services, Livestock Market News Section and the Divisions of Inspection and Animal Industry and the USDA's Market News Branch, Agricultural Marketing Service.

LIVESTOCK SUMMARY

CATTLE AND CALVES

Florida's January 1, 1984 inventory of all cattle and calves totaled 2,330,000 head, down 4 percent from 1983 and continues to rank 16th in the Nation. Nationally, the inventory was down 1 percent, 114 million head, and marks the second year of a declining inventory.

Florida's beef cow herd decreased by 1 percent from last year and totaled 1,410,000 head, the same as the January 1, 1982 level. Florida continues to rank 1st in beef cows among states east of the Mississippi River and 9th nationally.

Stocker calves shipped out of Florida by truck from areas east and south of the Suwannee River during 1983 totaled nearly 530,000 head, 5 percent more than 1982. Texas continues to be the number one destination state with 251,000 stocker calves shipped in 1983. Texas, Oklahoma, California, Arizona and New Mexico received 73 percent of the stocker calf outshipments while the southeastern states of Mississippi, Alabama and Georgia received 17 percent. Kansas and Arkansas round out the top ten receiving states with 5 percent of the total.

Cattle in Florida feedlots on January 1, 1984 totaled 80,000 head, 11 percent below 1983.

CASH RECEIPTS

Cash receipts from Florida's cattle and calves marketed during 1983 totaled $359,015,000, a 15 percent increase over 1982. The increase is a result of calf prices averaging $2.50 per cwt. over the 1982 average along with an increase of 13 percent in total pounds marketed.

Cash receipts from hog marketings decreased 23 percent from 1982 for a total of $36,466,000. Average price per cwt. during 1983 at $44.10 was $7.10 per cwt. below 1982. Total pounds marketed also decreased by 11 percent.

HOGS ON FARMS

The December 1, 1983 Florida inventory of hogs and pigs is estimated at 190,000 head, 34 percent less than a year ago. The breeding hog inventory was down 48 percent and market hog inventory was down 31 percent.

BEES AND HONEY

Due to budgetary restraints, the bee and honey estimating program was dropped in 1982. Only historical data are included in this summary.

SHEEP AND LAMBS

Florida estimates for sheep and lambs were discontinued after January 1978.

SURVEY METHODOLOGY

Primary data used in making cattle inventory estimates in this summary were obtained from probability surveys. Nationally, these surveys include approximately 70,000 farming operations heavily weighted to include operations having cattle. Information is collected by mail, telephone and personal interviews. Since all operations with cattle are not included in the sample, survey estimates are subject to sampling variability. This variability, as measured by the relative standard error, is about one percent at the national level for cattle inventory. This means that chances are approximately 95 out of 100 that a survey estimate will be within two percent of the complete coverage value if the same procedures were used to survey all producers. In Florida, approximately 1,400 cattle producers were surveyed with most of the large farms and ranches included in the count. As would be expected, the relative standard error for Florida and other states is greater than at the national level because of the smaller number of farms in the state samples.

Survey estimates are also subject to non-sampling errors such as omissions, duplications, recording and processing the data and mistakes in reporting. These errors cannot be measured directly, but they are minimized through rigid quality controls on the data collection process and a careful review of all reported data.

In setting the inventory estimates, survey information on births and deaths is used as well as inventory numbers. The survey results are combined with reliable data from other sources on slaughter, imports and exports to construct national and state balance sheets, which provide an additional check on survey inventory estimates.

ACKNOWLEDGMENT

This publication summarizes basic information concerning Florida's poultry industry. It is intended for the use of poultrymen, allied industries and all others who are interested in poultry production.

Many producers, hatcherymen, marketing agencies and others voluntarily supplied information used to develop these statistics. Their cooperation is sincerely appreciated.

This summary is made possible through a cooperative effort of the Florida Crop and Livestock Reporting Service and the Bureau of Market News, Division of Marketing and the Poultry and Egg Section, Division of Inspection. Production and inventory data are official State and USDA statistics prepared by the Florida Crop and Livestock Reporting Service.

Published July 1984

POULTRY AND EGG SUMMARY

CASH RECEIPTS

Florida cash receipts from broilers, eggs and other poultry products in 1983 totaled $233.1 million, up 4 percent from the 1982 total of $224.7 million. 1983 receipts from eggs totaled $123.1 million, up 1 percent and broiler sales totaled $107.1 million, up 7 percent. Other poultry product sales during 1983 totaled $2.9 million, up 4 percent from 1982.

The annual average price per pound of 27.5 cents, an increase of 2.5 cents from 1982 was the significant factor in the increase in total broiler sales as broiler production was 2 percent below the previous year. The 1983 annual average egg price of 50.0 cents per dozen was 0.4 cents higher than in 1982.

INVENTORY

Broilers raised during 1983 increased to a record 97,378,000 birds, slightly above 1982. The average number of layers during 1983 totaled 11,882,000, 1 percent below 1982.

PRODUCTION

Florida broiler production in 1983 totaled 389,512,000 pounds, 2 percent below 1982. Egg production totaled 2,959,000,000, down slightly from 1982. Eggs per layer averaged 249 during 1983, a 1 egg per layer increase.

During 1983, commercial hatcheries produced 147.2 million straight run chicks. Broiler-type chicks accounted for 75 percent of the total and egg-type 25 percent.

TERMS AND DEFINITIONS

MARKETING YEAR—Poultry production, price and value statistics since 1970 are for the marketing year beginning December 1 through November 30. All statistics prior to 1970 are on a calendar year basis. For comparability, in those tables where monthly data are shown, December entries always refer to the preceding year. All hatch and hatchery placement data are reported on a calendar year basis.

BROILERS are meat-type chickens raised commercially and usually marketed in 7-8 weeks.

EGGS include both table and hatching eggs. Table egg prices are calculated on a farm basis, cases exchanged. They include all grades and sizes, but exclude charges for hauling, grading or packaging. Prices for hatching eggs are not published separately. Annual egg production, price and value statistics are for table and hatching eggs combined.

OTHER POULTRY cash receipts include chickens other than broilers, turkeys and miscellaneous farm poultry products.

CASH RECEIPTS are the returns received by farmers for all sales.

GROSS INCOME includes cash receipts plus the value of home consumption.

CURRENT YEAR data are preliminary and subject to revision.

SURVEY METHODOLOGY—Estimates for hens and pullets of laying age, pullets not yet of laying age, and of egg production are based upon data obtained from a sample of commercial chicken and egg producers. This sample is selected from the universe of Florida poultry management units, and includes approximately 80 percent of the total commercial laying flock. Estimates are expected to be within five percent of the value obtained if a complete enumeration were undertaken each month.

During December of each year all known commercial egg producers in Florida are contacted. This complete enumeration establishes the annual universe of management units. Management units include all independent producers as well as contractors who report for all contractees.
